IN-STORE OPERATIONS · RETAIL

District ops managers manually rebuild BOPIS variance reviews every week.

Each review requires current-period, prior-period, and district-median comparisons before the manager can assess one store.

WHAT THE ROLE IS DOING

- Pulling BOPIS order counts and on-time-ready results from the fulfillment order events fact for the target store and district
- Recomputing the prior equal-length period, district median, and percentage-point variances for every review window
- Reformatting the results into a variance table and summary narrative before the weekly district ops call

---

WHY THIS COSTS MORE THAN THE HOURS

The cost is not just analyst time. When every store review is built manually, district leaders reach the decision point later, use inconsistent comparison logic, and spend ops-call time debating the numbers instead of the corrective action.

Not all of this work requires your judgment.

- **EXECUTION 50%** The execution layer retrieves order counts, computes on-time rates, compares current versus prior period and district median, applies materiality thresholds, and formats the variance output.
- **JUDGMENT 35%** The manager interprets whether the variance indicates a real execution problem, capacity strain, or a temporary fluctuation and decides what operational follow-up is warranted.
- **STRATEGIC 15%** District leadership retains decisions about staffing standards, escalation policy, process redesign, and broader omnichannel operating model changes.

The execution layer is what a Decision Intelligence workflow handles. The judgment and strategic layers remain yours.

What the workflow does — step by step.

1 **Store Rate**

Calculates the focus store's on-time pickup rate for the requested period and the prior equal-length period.

2 **Peer Median**

Computes the district median store performance for the same two periods and compares the focus store against it.

Each step queries the warehouse, executes business logic, and passes structured output to the next.

What this workflow does not do.

These decisions belong to the manager.

- It does not decide whether to escalate the store to a formal vendor or process review, reallocate labor across stores, determine whether a decline is acceptable given local operating conditions, or set district-wide staffing and fulfillment standards
- It also does not choose which store leaders to coach first or what corrective action plan to require.

The workflow's job is to get you into the meeting already holding a consistent, defensible analysis. What you do with it is yours.

What the output actually looks like.

WORKFLOW OUTPUT — SAMPLE RESPONSE

Store 014 posted 86.9% on-time pickup in 2026-03-01 to 2026-03-31 versus 91.1% in the prior period and 91.0% for the district median, a decline of 4.2 percentage points versus prior and 4.1 points below the district median.

1. **Prior-period decline** — 51% — The largest signal is the 4.2 percentage-point drop from 91.1% in the prior equal-length period to 86.9% in the current window.
2. **Peer underperformance** — 49% — The store is 4.1 percentage points below the current district median of 91.0%, indicating the issue is not just district-wide softness.

> ► Place Store 014 on the next district ops review agenda and check pickup readiness workflow, labor coverage, and exception handling for the March period.
