END-TO-END FULFILLMENT RELIABILITY · RETAIL

Failure-spike explanations take six labor hours every month.

Two analysts and one regional manager spend four hours per event across two failure-cluster events each month.

WHAT THE ROLE IS DOING

- Pulling delivery status logs, carrier performance records, road closure counts, and customer availability metrics into one working view
- Checking whether failures exceed historical regional norms, then reconciling threshold breaches across carrier, closure, and no-show signals
- Writing a fresh root-cause narrative with evidence and next-step suggestions before each regional operations review

---

WHY THIS COSTS MORE THAN THE HOURS

That manual process slows the last-mile route planner's response and increases the chance of inconsistent or weakly supported explanations. As a result, regional ops leads reach the decision point later and with less confidence in what is actually driving the failure spike.

Not all of this work requires your judgment.

- **EXECUTION 50%** The execution layer retrieves the relevant operating signals, evaluates threshold deviations, ranks likely drivers, and formats the evidence into a narrative artifact.
- **JUDGMENT 35%** The manager or planner still interprets the findings in local context, decides what action to take, and communicates the implications to operations and carrier stakeholders.
- **STRATEGIC 15%** Leadership retains decisions about carrier management policy, network design changes, staffing models, and broader service recovery investments.

The execution layer is what a Decision Intelligence workflow handles. The judgment and strategic layers remain yours.

What the workflow does — step by step.

1. **Detect Spike**
   Compares recent delivery failures in a region against the prior period to determine whether a failure cluster exists.

2. **Rank Drivers**
   Pulls operational, external, and customer signals for the peak failure date and ranks the most likely causes by weighted contribution.

3. **Write Narrative**
   Assembles the detected spike, ranked causes, and supporting evidence into a plain-language explanation with recommended follow-up actions.

Each step queries the warehouse, executes business logic, and passes structured output to the next.

What this workflow does not do.

These decisions belong to the manager.

- It does not decide whether to escalate a carrier issue into a contract or performance review, choose which remediation action to run first in the region, adjust staffing schedules or route design, or determine how regional leadership should communicate accountability to carriers and field teams.

The workflow's job is to get you into the meeting already holding a consistent, defensible analysis. What you do with it is yours.

What the output actually looks like.

WORKFLOW OUTPUT — SAMPLE RESPONSE

Delivery failures in Dallas were up 40% week over week on 2024-06-10, with the strongest deviation tied to carrier reliability falling to 80% versus the 85% threshold.

1. **Carrier C456 reliability drop** — 60% — Carrier C456 on-time rate fell to 0.80 on 2024-06-10, below the 0.85 threshold used for material reliability degradation.
2. **Road closures** — 25% — Dallas logged 3 road closures on 2024-06-10, above the >2 threshold associated with route disruption.
3. **Customer unavailability** — 15% — Customer no-show rate reached 0.20 on 2024-06-10, above the 0.15 threshold for elevated failed delivery risk.

> ► Review carrier C456 staffing and dispatch performance first, then validate alternate routing coverage for the closed corridors and reinforce customer notification timing for affected stops.

Generated by the Decision Intelligence workflow against sample data.

Run your own value estimate for delivery failure analysis — or talk to us about your last-mile route planning team.

The Cognitive Labor Value Calculator models team size, role cost, and automation coverage for this workflow so you can estimate labor impact quickly. It takes under two minutes to complete.
