END-TO-END FULFILLMENT RELIABILITY · RETAIL

# OTD decline reviews still take hours of manual reconciliation.

Each OTD or OTC review requires repeated data pulls, baseline comparisons, and narrative assembly across shipment and exception data.

### WHAT THE ROLE IS DOING

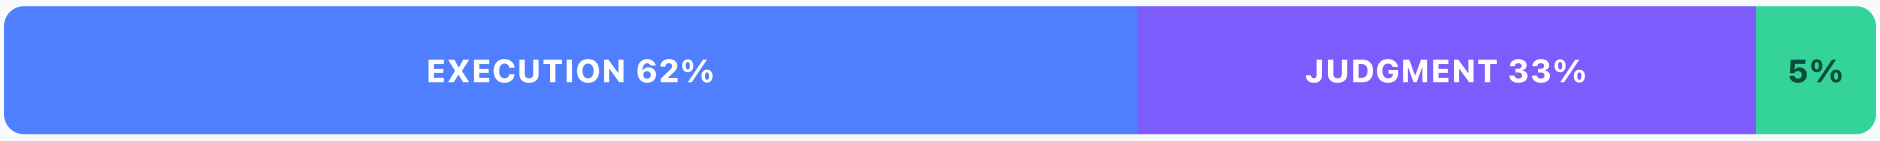
- Pulling OTD/OTC shipment outcomes and baseline-period volume from the shipment delivery fact table
- Re-cutting carrier-by-lane performance, reconciling missing or changed lane definitions, and checking materiality thresholds again
- Joining delivery exception logs, mapping categories like Late Linehaul and Customer Not Home, then drafting a fresh leadership narrative

---

### WHY THIS COSTS MORE THAN THE HOURS

The result is a slow and inconsistent explanation process for the Delivery Operations Manager. Leadership, carrier managers, and dispatch teams end up debating the data cut instead of agreeing on the first intervention.

# Not all of this work requires your judgment.



- **EXECUTION 62%** The execution layer retrieves shipment and exception data, calculates baseline deltas, attributes material movement by carrier and lane, and formats the briefing artifact.
- **JUDGMENT 33%** The manager still interprets ambiguous drivers, decides which corrective actions fit the operating context, and answers stakeholder challenges or follow-up questions.
- **STRATEGIC 5%** Strategic decisions such as carrier governance, SLA policy changes, and longer-term lane design remain with leadership.

---

*The execution layer is what a Decision Intelligence workflow handles. The judgment and strategic layers remain yours.*

# What the workflow does — step by step.

1 **Detect Variance**

Compares current-period OTD and OTC against the prior baseline window and checks whether the decline is material.

2 **Rank Hotspots**

Breaks the decline into carrier-by-lane slices and ranks the largest performance-driven hotspots.

3 **Assess Exceptions**

Measures shifts in exception categories and flags which issue types materially worsened in the analysis window.

4 **Build Brief**

Assembles the KPI deltas, ranked drivers, and evidence bullets into a leadership-ready attribution brief.

*— and one additional synthesis step*

Each step queries the warehouse, executes business logic, and passes structured output to the next.

# What this workflow does not do.

These decisions belong to the manager.

- It does not decide whether to escalate a carrier into a formal contract or scorecard review, approve temporary capacity shifts across regions, change customer promise windows on long-distance lanes, reprioritize which customer segments should receive proactive outreach first, or rewrite dispatch staffing and scheduling policies.

---

*The workflow's job is to get you into the meeting already holding a consistent, defensible analysis. What you do with it is yours.*

# What the output actually looks like.

WORKFLOW OUTPUT — SAMPLE RESPONSE

OTD fell to 90.0% from 94.2% and OTC fell to 88.4% from 91.5%, a material decline driven primarily by CARR_17 performance on ATL_BHM and ATL_HSV plus a Late Linehaul exception spike.

1. **CARR_17 on ATL_BHM** — 45% — OTD dropped from 95.1% to 85.2% on 8,450 analysis shipments, making this the largest single performance-driven hotspot.
2. **CARR_17 on ATL_HSV** — 30% — OTD dropped from 94.4% to 86.0% on 5,900 analysis shipments, reinforcing a carrier-specific reliability issue across two core lanes.
3. **Late Linehaul exception mix** — 18% — Late Linehaul exceptions increased from 4.0% to 6.7% of shipments, adding evidence that the service degradation is tied to linehaul execution rather than isolated order issues.

> ► Open a carrier incident for CARR_17, shift temporary backup capacity to CARR_03 on ATL_BHM and ATL_HSV for the next 7 days, and move tender cutoff earlier while reviewing linehaul departure adherence.

Generated by the Decision Intelligence workflow against sample data.

# Run your own value estimate for delivery operations — or talk to us about your OTD driver attribution workflow.

The Cognitive Labor Value Calculator models team size, fully loaded role cost, and how much execution-layer work this workflow can absorb. It takes under two minutes to generate a planning estimate.
